

## Assignment 8.4 Ai Assisted Coding

Htno:2303a51293

Btno:05

### Task 1: Developing a Utility Function Using TDD

#### Scenario

You are working on a small utility library for a larger software system. One of the required functions should calculate the square of a given number, and correctness is critical because other modules depend on it.

#### Task Description

Following the Test Driven Development (TDD) approach:

1. First, write unit test cases to verify that a function correctly returns the square of a number for multiple inputs.
2. After defining the test cases, use GitHub Copilot or Cursor AI to generate the function implementation so that all tests pass.

Ensure that the function is written only after the tests are created.

#### Expected Outcome

- A separate test file and implementation file
- Clearly written test cases executed before implementation
- AI-assisted function implementation that passes all tests •

Demonstration of the TDD cycle: test → fail → implement → pass

Code:

The image displays two sequential screenshots of a Google Colab notebook titled 'Untitled30.ipynb'. The browser tabs at the top include 'word - Search', 'Document 11.docx', 'google colab - Search', and 'Untitled30.ipynb - Colab'. The address bar shows the URL: [https://colab.research.google.com/drive/18FWbvBLJlvCTXqsvYyNt7zYXoSnKhINR#scrollTo=cO1kcN\\_N8cWL](https://colab.research.google.com/drive/18FWbvBLJlvCTXqsvYyNt7zYXoSnKhINR#scrollTo=cO1kcN_N8cWL).

The first screenshot shows the initial code in the notebook:

```
[1] import unittest

# ---- TEST CASES (written first in TOD) ----
class TestSquareFunction(unittest.TestCase):

    def test_positive_number(self):
        self.assertEqual(square(4), 16)

    def test_negative_number(self):
        self.assertEqual(square(-3), 9)

    def test_zero(self):
        self.assertEqual(square(0), 0)

    def test_large_number(self):
        self.assertEqual(square(100), 10000)

[2] # ---- IMPLEMENTATION (written AFTER tests) ----
def square(n):
    return n * n
```

The second screenshot shows the same notebook after adding a third cell to run the tests:

```
[1] def test_positive_number(self):
    self.assertEqual(square(4), 16)

    def test_negative_number(self):
        self.assertEqual(square(-3), 9)

    def test_zero(self):
        self.assertEqual(square(0), 0)

    def test_large_number(self):
        self.assertEqual(square(100), 10000)

[2] # ---- IMPLEMENTATION (written AFTER tests) ----
def square(n):
    return n * n

[3] unittest.main(argv=[''], verbosity=2, exit=False)
```

Both screenshots show the notebook interface with a left sidebar containing icons for file explorer, search, and other tools. The bottom status bar indicates '9:40 AM' and 'Python 3'.

Output:

A screenshot of a Google Colab notebook interface. The browser tabs at the top include 'word - Search', 'Document 11.docx', 'google colab - Search', and 'Untitled30.ipynb - Colab'. The notebook's address bar shows a URL from 'https://colab.research.google.com'. The notebook title is 'Untitled30.ipynb'. The menu bar includes 'File', 'Edit', 'View', 'Insert', 'Runtime', 'Tools', and 'Help'. Below the menu is a toolbar with 'Commands', '+ Code', '+ Text', and 'Run all'. On the right, there are icons for chat, settings, and a 'Share' button. The main code area shows a Python test suite using unittest. The tests are: 'test\_large\_number', 'test\_negative\_number', 'test\_positive\_number', and 'test\_zero'. All tests passed, indicated by '... ok'. The output shows 'Ran 4 tests in 0.009s' and 'OK'. The bottom status bar shows 'Variables', 'Terminal', a blue circular icon, '9:40 AM', and 'Python 3'.

## Task 2: Email Validation for a User Registration System

### Scenario

You are developing the backend of a user registration system. One requirement is to validate user email addresses before storing them in the database.

### Task Description

Apply Test Driven Development by:

1. Writing unit test cases that define valid and invalid email formats (e.g., missing @, missing domain, incorrect structure).
2. Using AI assistance to implement the `validate_email()` function based strictly on the behavior described by the test cases.

The implementation should be driven entirely by the test expectations.

### Expected Outcome

- Well-defined unit tests using unittest or pytest
- An AI-generated email validation function
- All test cases passing successfully

- Clear alignment between test cases and function behavior Code:

The image shows two screenshots of a Google Colab notebook, illustrating the process of writing tests and then implementing a function to pass them.

**Top Screenshot:** The notebook is titled "Untitled30.ipynb". The code cell [4] contains the following Python code:

```
import unittest

# ----- TEST CASES (WRITTEN BEFORE FUNCTION) -----
class TestEmailValidation(unittest.TestCase):

    def test_valid_email(self):
        self.assertTrue(validate_email("user@example.com"))

    def test_missing_at_symbol(self):
        self.assertFalse(validate_email("userexample.com"))

    def test_missing_domain(self):
        self.assertFalse(validate_email("user@"))

    def test_missing_username(self):
        self.assertFalse(validate_email("@example.com"))

    def test_invalid_structure(self):
        self.assertFalse(validate_email("user@com"))

    def test_email_with_numbers(self):
        self.assertTrue(validate_email("user123@gmail.com"))
```

The bottom status bar shows "9:46 AM" and "Python 3".

**Bottom Screenshot:** The notebook is still titled "Untitled30.ipynb". The code cell [5] contains the following Python code:

```
#AI-Generated Implementation

import re

# ----- IMPLEMENTATION (AFTER TESTS) -----
def validate_email(email):
    pattern = r'^[A-Za-z0-9._%+-]+@[A-Za-z0-9.-]+\.[A-Za-z]{2,}$'
    return re.match(pattern, email) is not None
```

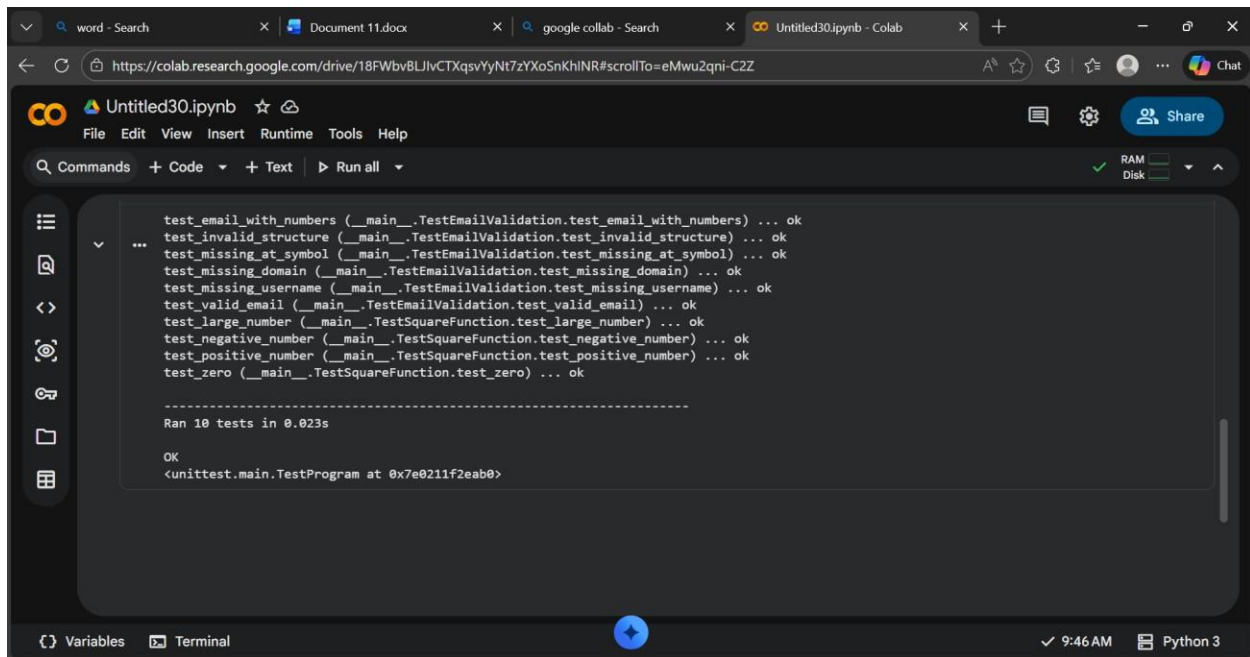

The code cell [6] contains the following Python code:

```
#Run Tests

unittest.main(argv=[''], verbosity=2, exit=False)
```

The bottom status bar shows "9:46 AM" and "Python 3".

Output:

The screenshot shows a Google Colab notebook interface. The top bar includes tabs for 'word - Search', 'Document 11.docx', 'google colab - Search', and 'Untitled30.ipynb - Colab'. The notebook title is 'Untitled30.ipynb'. The left sidebar contains icons for file explorer, search, code editor, and other tools. The main code editor area displays the following output:

```
test_email_with_numbers (__main__.TestEmailValidation.test_email_with_numbers) ... ok
test_invalid_structure (__main__.TestEmailValidation.test_invalid_structure) ... ok
test_missing_at_symbol (__main__.TestEmailValidation.test_missing_at_symbol) ... ok
test_missing_domain (__main__.TestEmailValidation.test_missing_domain) ... ok
test_missing_username (__main__.TestEmailValidation.test_missing_username) ... ok
test_valid_email (__main__.TestEmailValidation.test_valid_email) ... ok
test_large_number (__main__.TestSquareFunction.test_large_number) ... ok
test_negative_number (__main__.TestSquareFunction.test_negative_number) ... ok
test_positive_number (__main__.TestSquareFunction.test_positive_number) ... ok
test_zero (__main__.TestSquareFunction.test_zero) ... ok

-----
Ran 10 tests in 0.023s

OK
<unittest.main.TestProgram at 0x7e0211f2eab0>
```

At the bottom of the interface, there are tabs for 'Variables' and 'Terminal', and a status bar showing '9:46 AM' and 'Python 3'.

## Task 3: Decision Logic Development Using TDD

### Scenario

In a grading or evaluation module, a function is required to determine the maximum value among three inputs. Accuracy is essential, as incorrect results could affect downstream decision logic.

### Task Description

Using the TDD methodology:

1. Write test cases that describe the expected output for different combinations of three numbers.
2. Prompt GitHub Copilot or Cursor AI to implement the function logic based on the written tests.

Avoid writing any logic before test cases are completed.

### Expected Outcome

- Comprehensive test cases covering normal and edge cases
- AI-generated function implementation
- Passing test results demonstrating correctness

- Evidence that logic was derived from tests, not assumptions Code:

The image displays two screenshots of a Google Colab notebook, illustrating the Test-Driven Development (TDD) process for a function named `max_of_three`.

**Top Screenshot:** The notebook shows the initial test cases being written. The code is as follows:

```
[7] import unittest

# ----- TEST CASES FIRST (TDD) -----
class TestMaxOfThree(unittest.TestCase):

    def test_normal_numbers(self):
        self.assertEqual(max_of_three(2, 8, 5), 8)

    def test_first_is_largest(self):
        self.assertEqual(max_of_three(10, 3, 6), 10)

    def test_negative_numbers(self):
        self.assertEqual(max_of_three(-1, -5, -3), -1)

    def test_all_equal(self):
        self.assertEqual(max_of_three(4, 4, 4), 4)

    def test_two_equal_largest(self):
        self.assertEqual(max_of_three(7, 7, 2), 7)
```

**Bottom Screenshot:** The notebook shows the implementation of the function after the tests are written. The code is as follows:

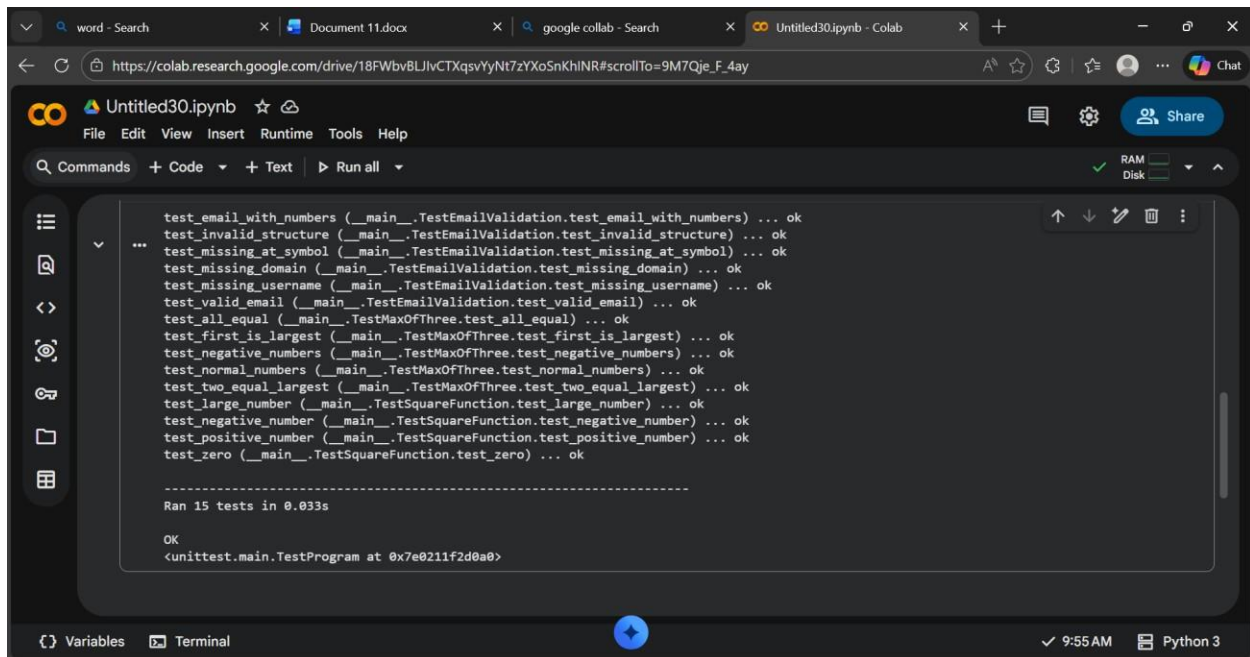

```
[8] #AI-Generated Implementation

# ----- IMPLEMENTATION (AFTER TESTS) -----
def max_of_three(a, b, c):
    return max(a, b, c)

[9] #Run Tests

unittest.main(argv=[''], verbosity=2, exit=False)
```

Output:

The screenshot shows a Google Colab notebook titled 'Untitled30.ipynb'. The code cell contains 15 unit tests using the unittest module. The tests are organized into two groups: email validation tests and mathematical function tests. All tests passed successfully, as indicated by the '... ok' status for each. The output shows 'Ran 15 tests in 0.033s' and 'OK'.

```
test_email_with_numbers (__main__.TestEmailValidation.test_email_with_numbers) ... ok
test_invalid_structure (__main__.TestEmailValidation.test_invalid_structure) ... ok
test_missing_at_symbol (__main__.TestEmailValidation.test_missing_at_symbol) ... ok
test_missing_domain (__main__.TestEmailValidation.test_missing_domain) ... ok
test_missing_username (__main__.TestEmailValidation.test_missing_username) ... ok
test_valid_email (__main__.TestEmailValidation.test_valid_email) ... ok
test_all_equal (__main__.TestMaxOfThree.test_all_equal) ... ok
test_first_is_largest (__main__.TestMaxOfThree.test_first_is_largest) ... ok
test_negative_numbers (__main__.TestMaxOfThree.test_negative_numbers) ... ok
test_normal_numbers (__main__.TestMaxOfThree.test_normal_numbers) ... ok
test_two_equal_largest (__main__.TestMaxOfThree.test_two_equal_largest) ... ok
test_large_number (__main__.TestSquareFunction.test_large_number) ... ok
test_negative_number (__main__.TestSquareFunction.test_negative_number) ... ok
test_positive_number (__main__.TestSquareFunction.test_positive_number) ... ok
test_zero (__main__.TestSquareFunction.test_zero) ... ok

-----
Ran 15 tests in 0.033s

OK
<unittest.main.TestProgram at 0x7e0211f2d0a0>
```

## Task 4: Shopping Cart Development with AI-Assisted TDD

### Scenario

You are building a simple shopping cart module for an e-commerce application.

The cart must support adding items, removing items, and calculating the total price accurately.

### Task Description

Follow a test-driven approach:

1. Write unit tests for each required behavior:

- o Adding an item
- o Removing an item
- o Calculating the total price

2. After defining all tests, use AI tools to generate the ShoppingCart class and its methods so that the tests pass.

Focus on behavior-driven testing rather than implementation details.

### Expected Outcome

- Unit tests defining expected shopping cart behavior

- AI-generated class implementation
- All tests passing successfully
- Clear demonstration of TDD applied to a class-based design Code:

The image displays two sequential screenshots of a Google Colab notebook titled 'Untitled30.ipynb', illustrating the Test-Driven Development (TDD) process for a class-based design.

**Top Screenshot (Test Cases):**

- The code cell [10] contains the following Python code:

```
import unittest

# ----- TESTS FIRST (TDD RULE) -----
class TestShoppingCart(unittest.TestCase):

    def test_add_item(self):
        cart = ShoppingCart()
        cart.add_item("Book", 100)
        self.assertEqual(cart.calculate_total(), 100)

    def test_add_multiple_items(self):
        cart = ShoppingCart()
        cart.add_item("Book", 100)
        cart.add_item("Pen", 20)
        self.assertEqual(cart.calculate_total(), 120)

    def test_remove_item(self):
        cart = ShoppingCart()
        cart.add_item("Book", 100)
        cart.remove_item("Book")
        self.assertEqual(cart.calculate_total(), 0)
```

The status bar at the bottom indicates the code is running successfully (green checkmark) at 9:58 AM using Python 3.

**Bottom Screenshot (Implementation):**

- The code cell [11] contains the following Python code, titled '#AI-Generated Implementation':

```
# ----- IMPLEMENTATION AFTER TESTS -----
class ShoppingCart:

    def __init__(self):
        self.items = {}

    def add_item(self, name, price):
        self.items[name] = price

    def remove_item(self, name):
        if name in self.items:
            del self.items[name]

    def calculate_total(self):
        return sum(self.items.values())
```

The status bar at the bottom indicates the code is running successfully (green checkmark) at 9:58 AM using Python 3.

Output:

## Task 5: String Validation Module Using TDD

### Scenario

You are working on a text-processing module where a function is required to identify whether a given string is a palindrome. The function must handle different cases and inputs reliably.

## Task Description

Using Test Driven Development:

1. Write test cases for a palindrome checker covering:

o Simple palindromes

o Non-palindromes o

Case variations

2. Use GitHub Copilot or Cursor AI to generate the `is_palindrome()` function based on the test case expectations.

The function should be implemented only after tests are written.

Expected Outcome

- Clearly written test cases defining expected behavior
  - AI-assisted implementation of the palindrome checker
  - All test cases passing successfully • Evidence of TDD methodology applied correctly
- Code:

The image displays two sequential screenshots of a Google Colab notebook titled 'Untitled30.ipynb'. The browser tabs at the top include 'word - Search', 'Document 11.docx', 'google colab - Search', and 'Untitled30.ipynb - Colab'. The URL bar shows the Colab environment address.

**Top Screenshot:** The notebook interface shows a code cell [13] with the following Python code:

```
import unittest

# ----- TEST CASES FIRST (TDD) -----
class TestPalindrome(unittest.TestCase):

    def test_simple_palindrome(self):
        self.assertTrue(is_palindrome("madam"))

    def test_not_palindrome(self):
        self.assertFalse(is_palindrome("hello"))

    def test_case_insensitive(self):
        self.assertTrue(is_palindrome("Madam"))

    def test_with_spaces(self):
        self.assertTrue(is_palindrome("nurses run"))

    def test_single_character(self):
        self.assertTrue(is_palindrome("a"))
```

The bottom status bar indicates '10:03 AM' and 'Python 3'.

**Bottom Screenshot:** The notebook interface shows the same code cell [13] with the following Python code:

```
self.assertTrue(is_palindrome("nurses run"))

def test_single_character(self):
    self.assertTrue(is_palindrome("a"))
```

Below the code cell, there are two sections:

- #Ai Implemented Code**: A code cell [14] containing the implementation of the `is_palindrome` function:

```
# ----- IMPLEMENTATION AFTER TESTS -----
def is_palindrome(s):
    s = s.replace(" ", "").lower()
    return s == s[::-1]
```
- #Run Tests**: A code cell [15] containing the command to run the tests:

```
unittest.main(argv=[''], verbosity=2, exit=False)
```

The bottom status bar indicates '10:05 AM' and 'Python 3'.

Output:

word - Search x Document 11.docx x google colab - Search x Untitled30.ipynb - Colab x
